

Northwind Retail Resource Utilization Snapshot

Synthetic training document | 30-day window ending August 31, 2026 | Azure Monitor-style metrics

Compute and application capacity

Resource	Environment	Observed utilization	Operational interpretation	Recommendation status
analytics-vm-01 / Standard_D8s_v5	Development	CPU p50 6%, p95 19%; memory p95 42%; uptime 99.8%	Likely oversized and unscheduled. No production SLA applies.	Test D4s_v5 and schedule off-hours.
web-prod-01 / Standard_D4s_v5	Production	CPU p50 31%, p95 68%; memory p95 71%	Capacity supports normal peak; no right-size conclusion from one month.	Keep; monitor holiday peak.
democost-app-plan / P1v3 x3	Production	CPU p50 18%, p95 44%; memory p95 61%; requests p95 188/min	Three always-on workers may be above current demand, but deployments and seasonal traffic matter.	Run scale-down test in staging; require web-team approval.
democost-sql / finance-prod-db	Production	DTU p50 37%, p95 76%; storage 62%; log IO p95 58%	Not clearly over-provisioned. Peak activity is close enough to retain current tier.	No immediate downgrade; evaluate reservation.

Storage and network capacity

Resource	Observed signal	Risk / context	Recommended next step
analytics-vm-01-data / Premium_LRS 1024 GB	Unattached for 43 days; no reads or writes; 14 snapshots; \$122/month	Could be a recovery artifact; deletion is irreversible without snapshot retention.	Confirm with data-platform owner; delete disk after 7-day approval window.
democostarchive / Standard_LRS Hot	2.8 TB; 74% blobs not read in 90 days; lifecycle policy absent	Archive retrieval may be slow and may incur rehydration cost.	Apply Cool after 30 days and Archive after 180 days for approved container prefix.
democost-unused-ip / Standard static IP	No IP address and no NIC or load balancer association for 61 days	Confirm it is not reserved for a planned cutover.	Remove after Cloud Ops change approval.
democostregistry / Premium	3.1 TB images; 84 untagged images older than 60 days	Premium may be required for geo-replication or private-link use.	Check feature use before SKU change; enforce image retention.

Metric reliability note

Metrics are synthetic but structured like a production review. Capacity changes require a longer seasonal window, application-owner review, and rollback plan. A low average alone is not evidence that a production resource is safe to downsize.
