

Tailspin Data — Compute and Retention Review

Resource: tailspin-batch-vm-02

Utilization evidence: Over the last 28 nightly batch runs, CPU p95 was 31%, memory p95 was 46%, and peak queue latency remained within the 10-minute SLO. A smaller SKU is technically feasible only after the September close validation.

Rollback safeguard: Keep the current size available for one batch cycle and restore it if queue latency exceeds the SLO.

Resource: tailspin-orphan-disk-03

Utilization evidence: This unattached 256 GB disk has had no reads, writes, or attachment events for 45 days. No owner decision, retention decision, or dependency review has yet been recorded.

Resource: tailspin-archive-disk-02

Known exception: This unattached disk contains finance recovery artifacts. The finance forecast rollback window closes September 30. Retain it until the owner sets retentionUntil or approves deletion after legal review.
